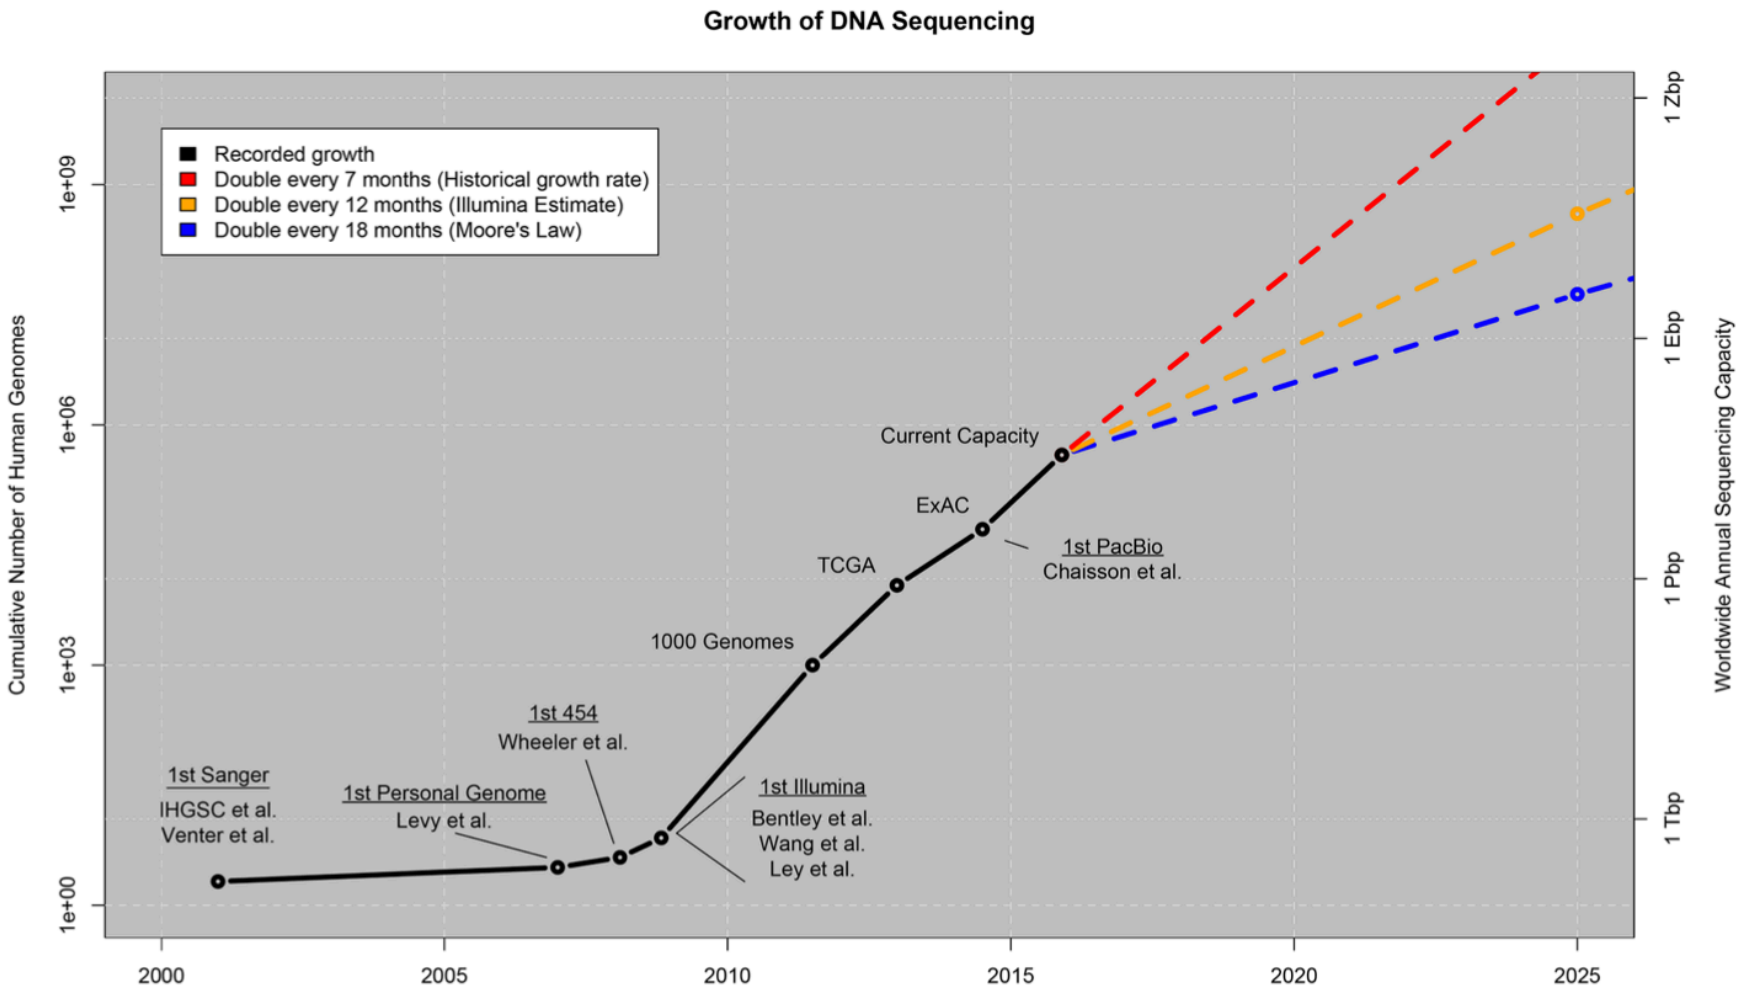
Introduction to NGS

Hubert Rehrauer

NGS Data Increase

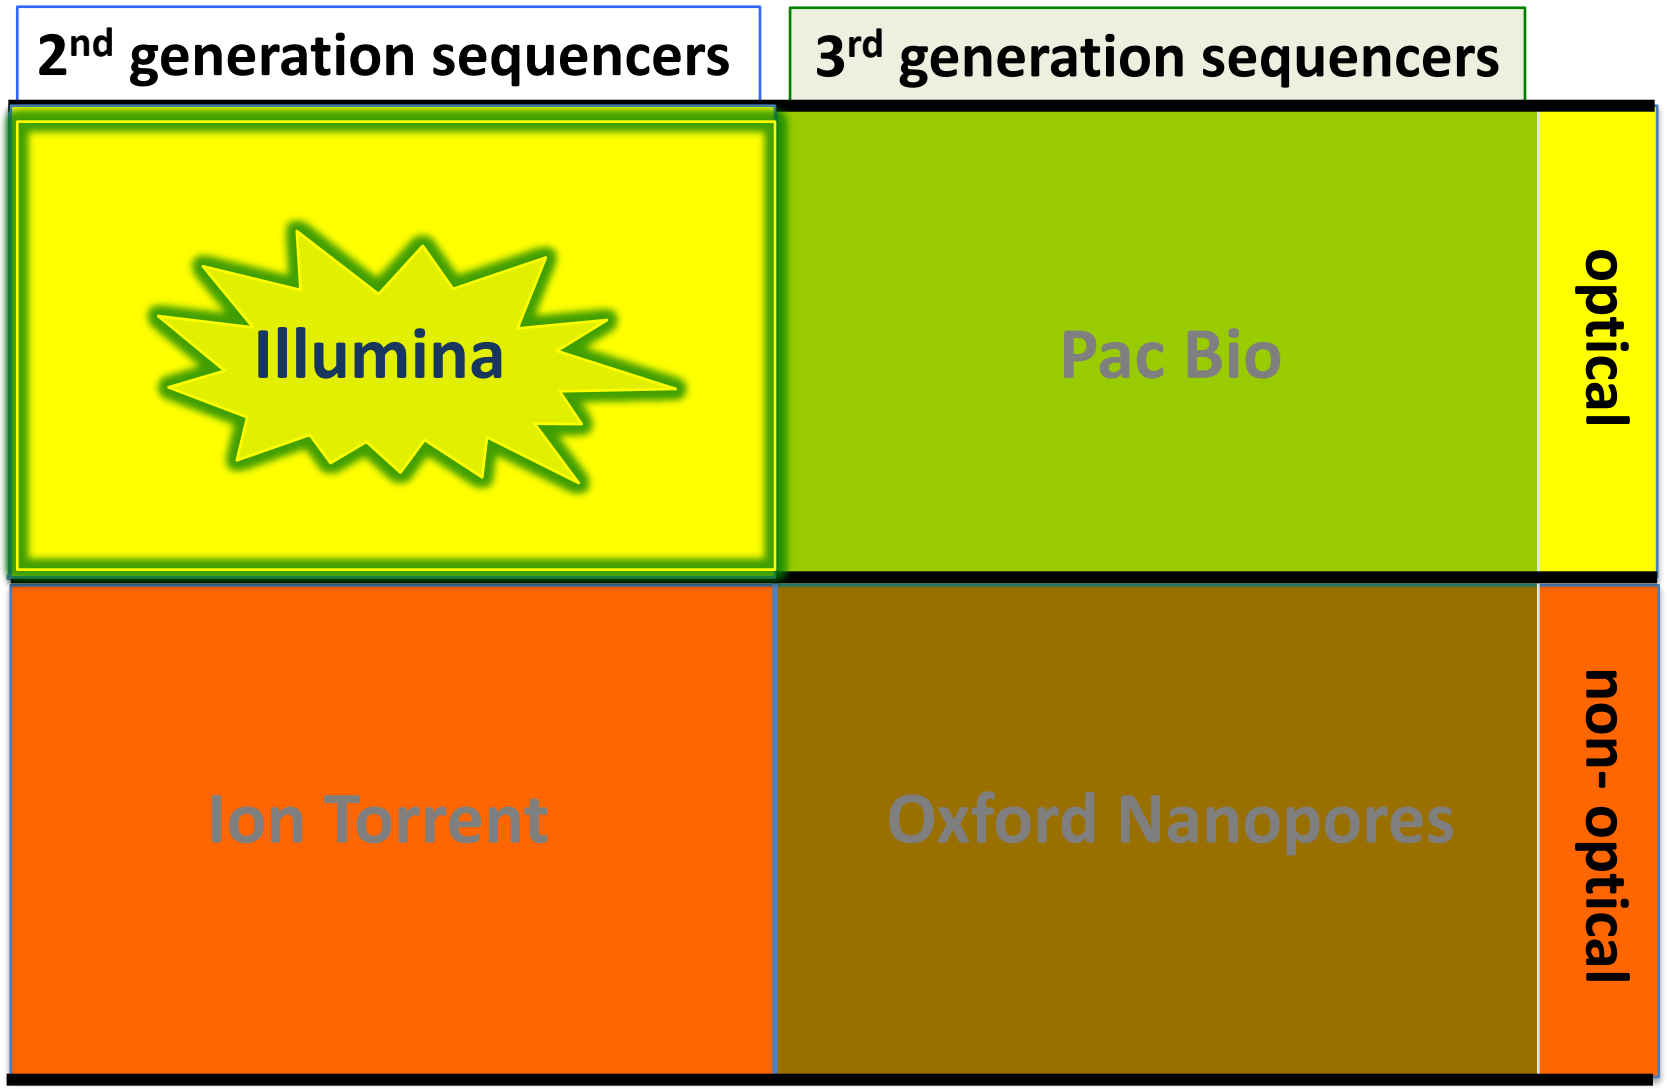


- NGS data increases faster than computer speed

Stephens ZD etal. (2015) Big Data: Astronomical or Genomical? PLoS Biol 13(7): e1002195.

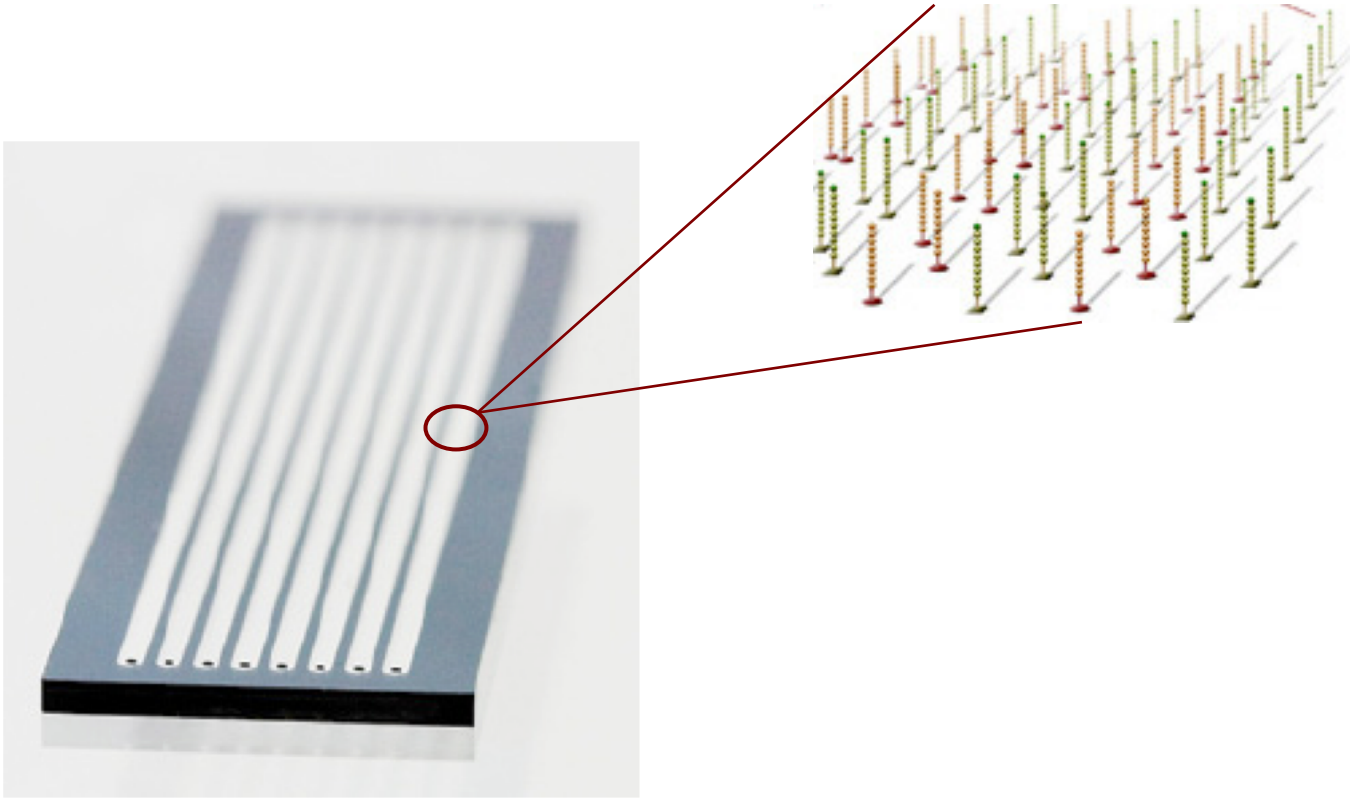
Ingredients for the success

- Evolution has yielded DNA and RNA molecules for information storage and transfer. They have good properties to be read (**measured**)
- NGS technologies rely on
  - **massive parallelization**
  - measurement process is done by individual molecules (**cheap and fast**)

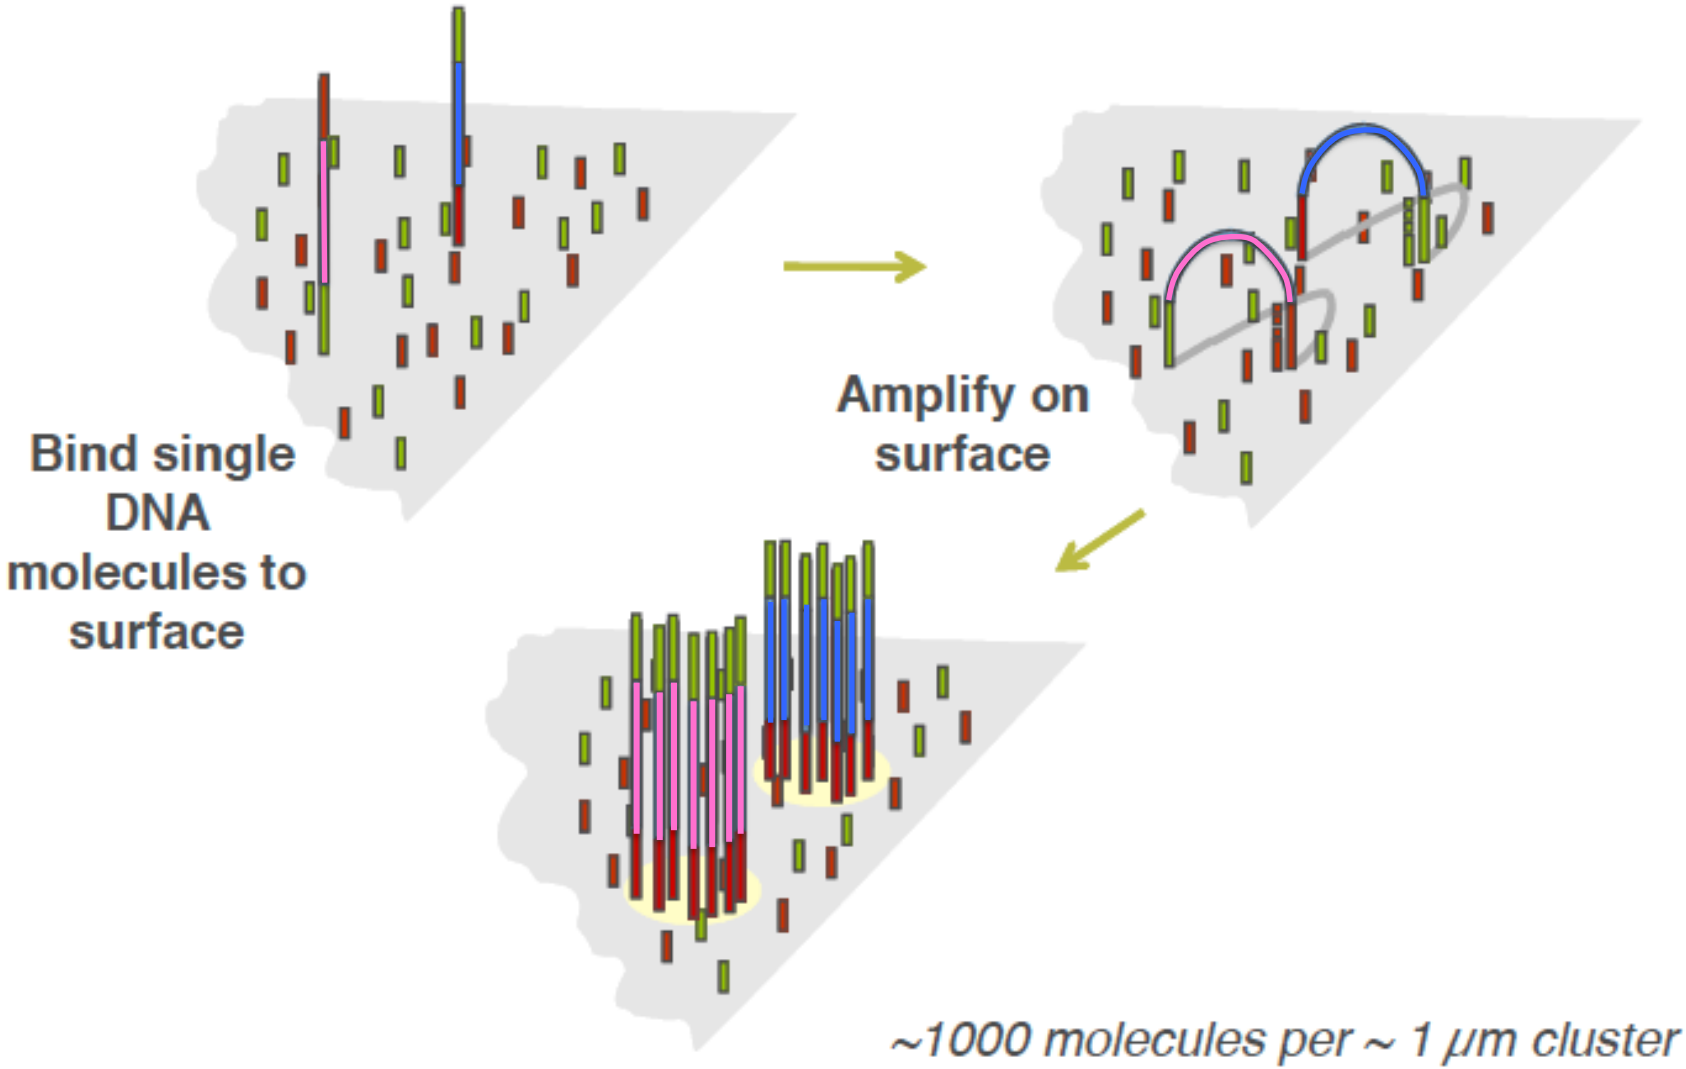


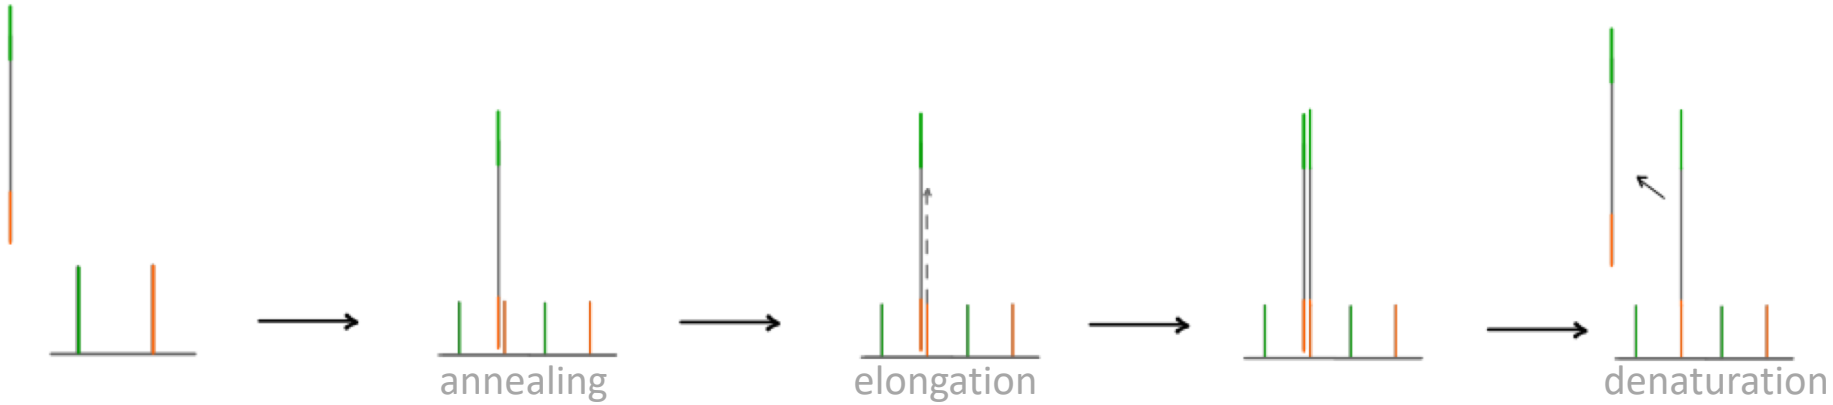
2nd generation sequencers
3rd generation sequencers
Illumina
Pac Bio
optical
Ion Torrent
Oxford Nanopores
non- optical

Illumina Flow cell

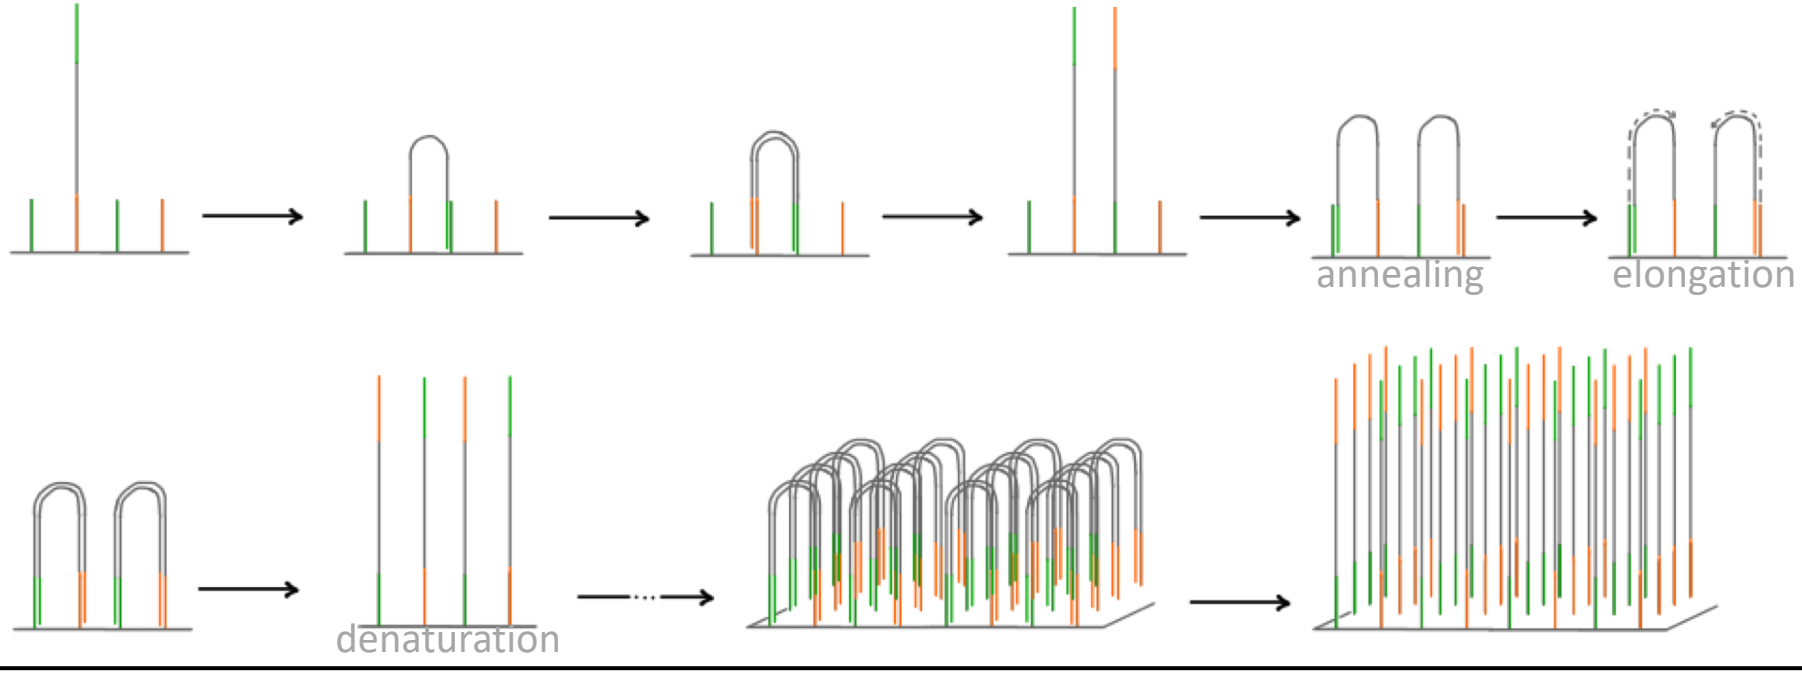


Cluster generation overview

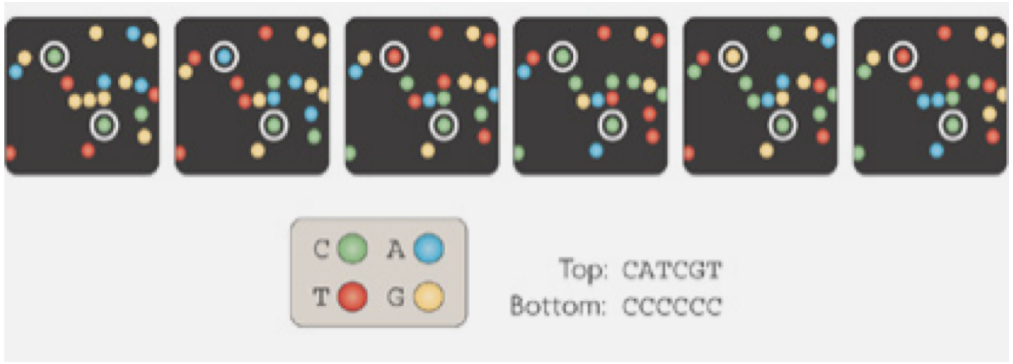


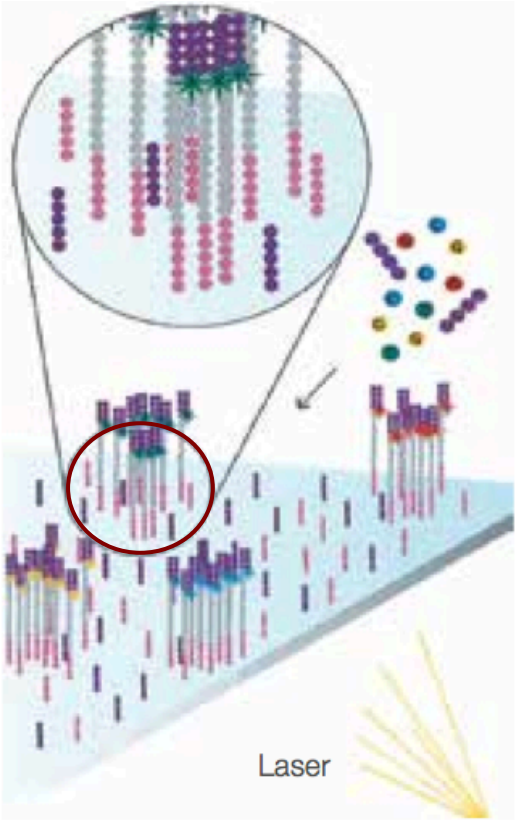


bridge amplification

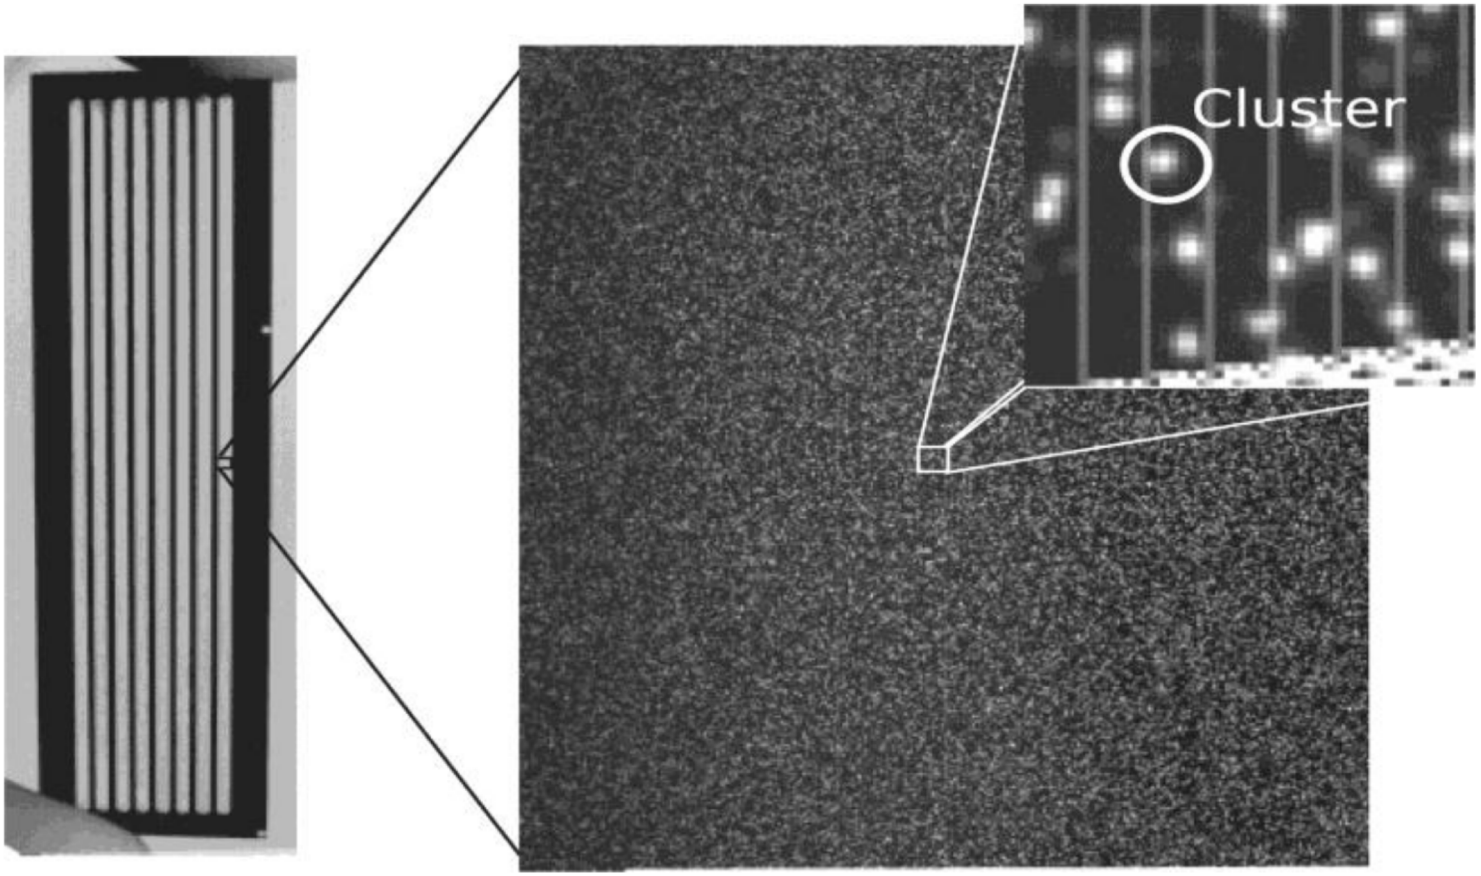


Illumina Sequencing





The first sequencing cycle begins by adding four labeled reversible terminators, primers, and DNA polymerase.



Cluster

Phred scores measure base call accuracy

- P
  - error probability of a given base call
- *Q*
  - $-10log_{10}P$
- Assign to each base
- Range from 0-41

Phred Quality Score	Probability of Incorrect Base Call	Base Call Accuracy
10	1 in 10	90%
20	1 in 100	99%
30	1 in 1,000	99.9%
40	1 in 10,000	99.99%
50	1 in 100,000	99.999%

Ewing B, Green P. 1998. Genome Res. 8(3):186-194.

http://en.wikipedia.org/wiki/Phred_quality_score

Phred scores are stored with sequences

- FASTQ
  - 4 lines:
    1. Header line for Read (starts with "@" and the sequence ID)
    2. Sequence
    3. Header line for Qualities (starts with "+")
    4. Quality score (represented in ASCII format)

```
@HWI-ST1034:40:C08PJACXX:2:1101:20681:1994 1:N:0:ATCACG
CTCGNAGACTGGCAACTTGTTCTGGTTTACTGCACCTTCTTTTAAAGGCAGAAAGGC
+
CCCF#2ADHHHGHJJJIJJHIIIJJHIJJJJJJJJJBGIIJJJJJJJJJJJJJJIJ
```

Phred scores can be **ASCII encoded**

- Add an offset and convert the sum to ASCII

- Current format
  - **Illumina 1.9 (i.e. Sanger format)**
  - Phred scoring: 0-41;
  - Offset: 33
  - 41+33=74 (J)
  - All current sequencers

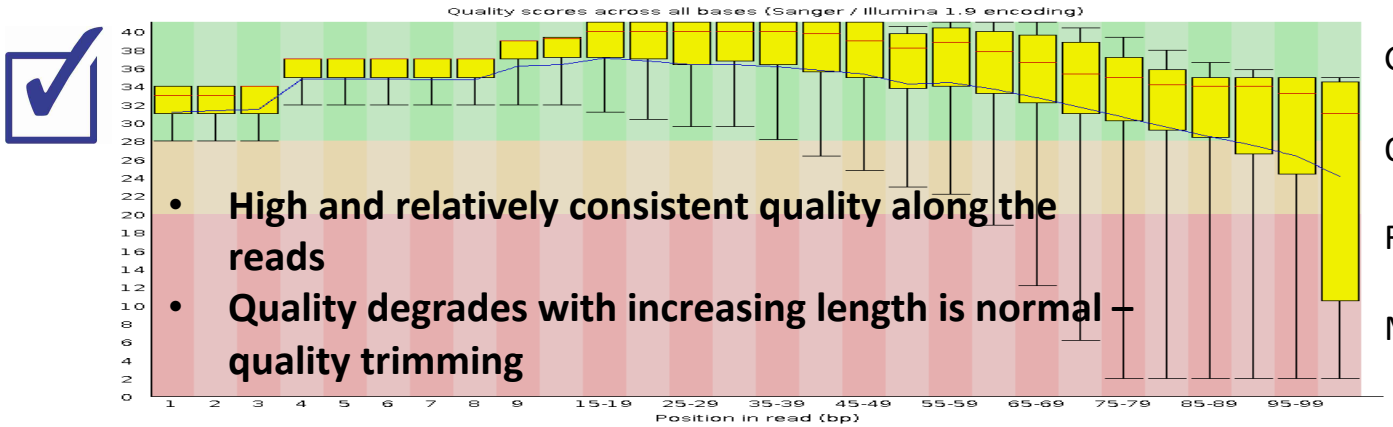
Read Quality Control

- Library construction could introduce bias
  - Fragmentation, ligation, amplification
  - GC bias
  - Over-amplification
  - Contamination
- Sequencing errors
  - Chemical, optical, computational

Platform	Primary error	Error rate (%)
Illumina	Substitution	0.1
PacBio	Indel	12 (consensus: 1)
Oxford Nanopore	Indel	3 - 20

Per base sequence quality - FastQC

- Range of quality values across all bases at each position



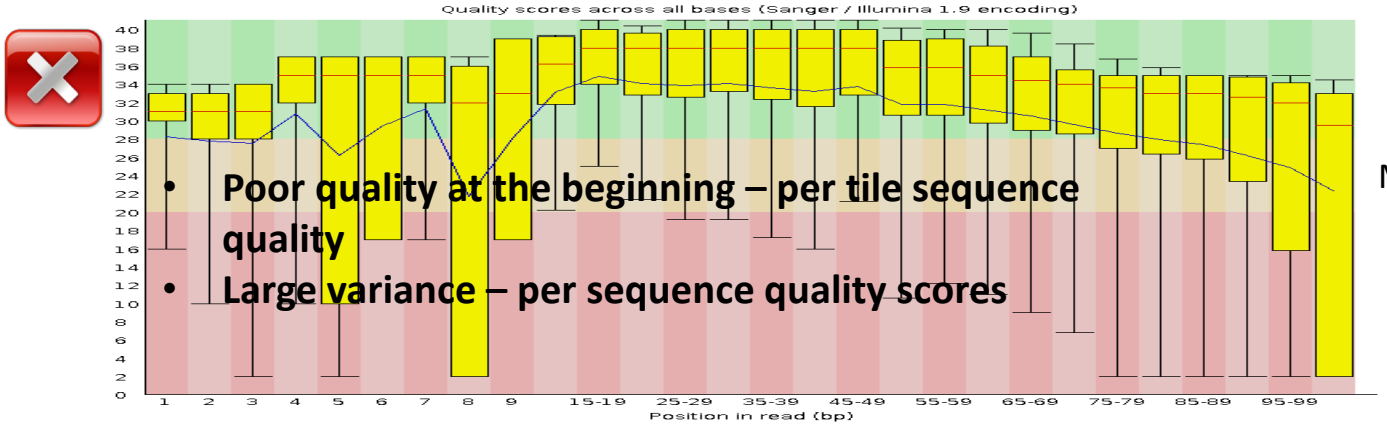
- **High and relatively consistent quality along the reads**
- **Quality degrades with increasing length is normal – quality trimming**

Green: >Q28, good

Orange: >Q20, reasonable

Red:<Q20, poor

Median > Q25

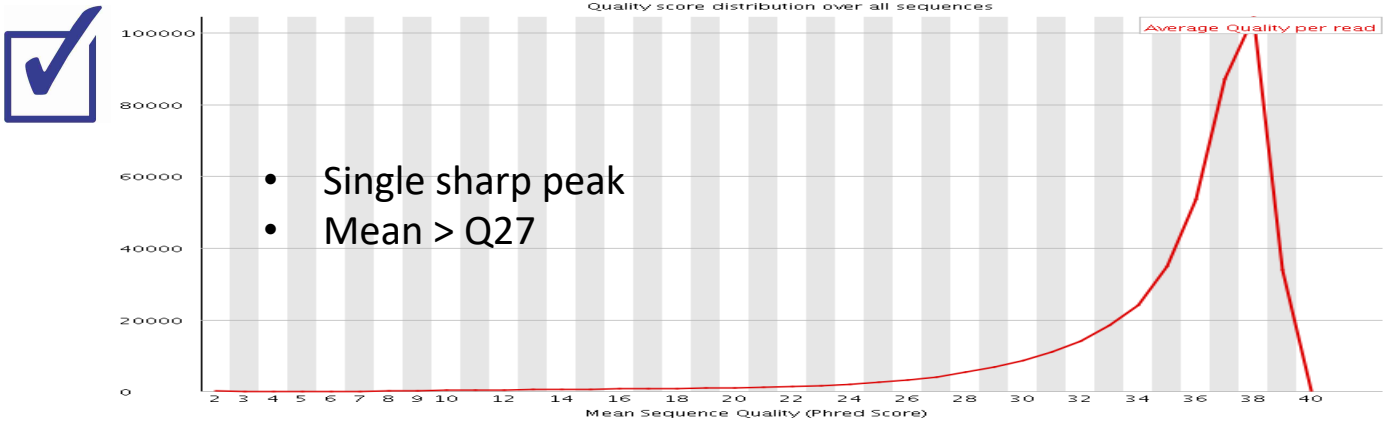


- **Poor quality at the beginning – per tile sequence quality**
- **Large variance – per sequence quality scores**

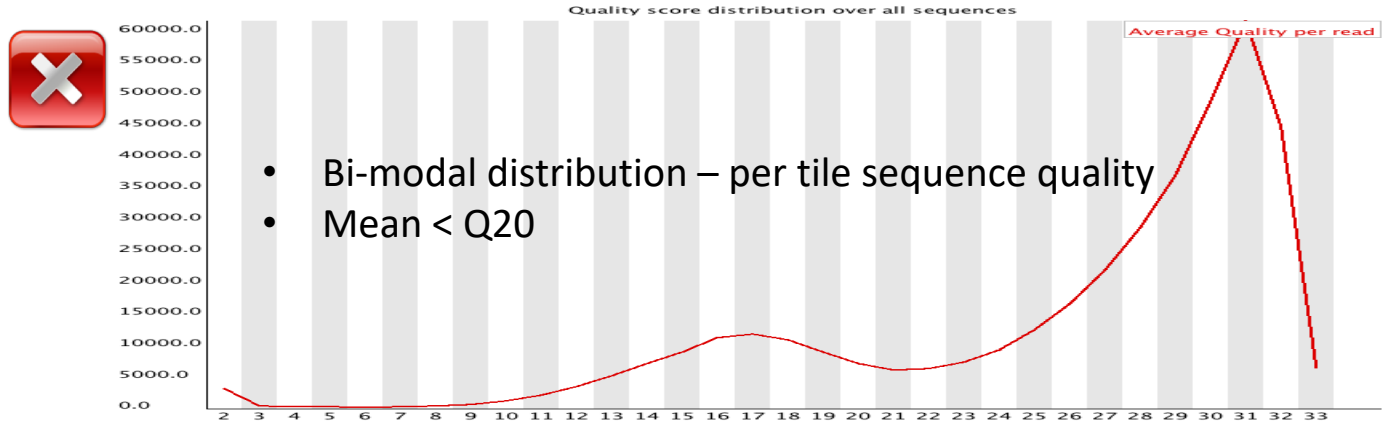
Median < Q20

Per sequence quality scores - FastQC

- Subset of sequences with universally low quality values



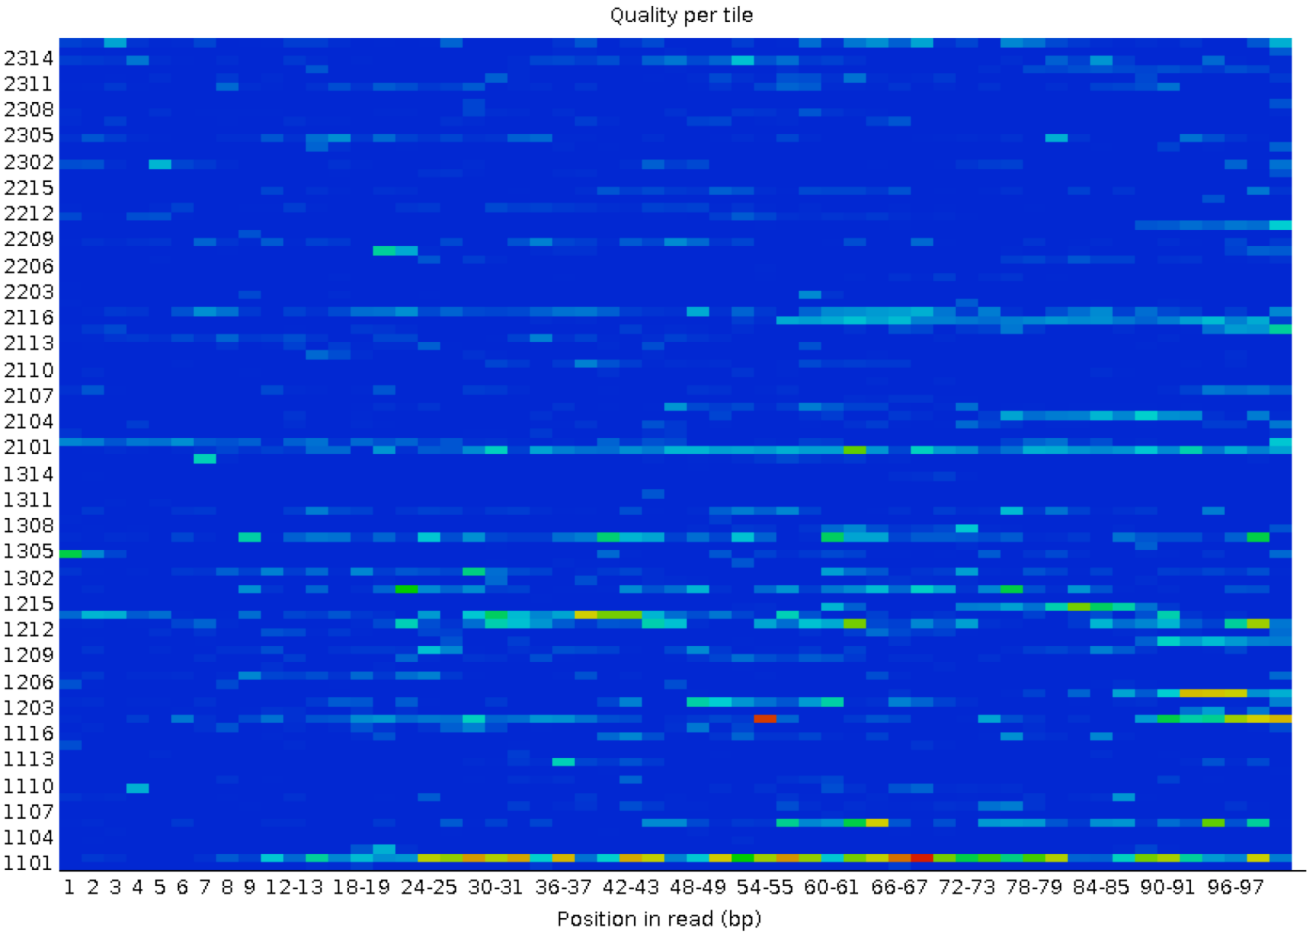
- Single sharp peak
- Mean > Q27



- Bi-modal distribution – per tile sequence quality
- Mean < Q20

Per tile sequence quality - FastQC

- Quality scores from each tile across all bases - loss in quality associated with only one part of the flowcell



Deviation from average quality

Cold colors: ≥ average

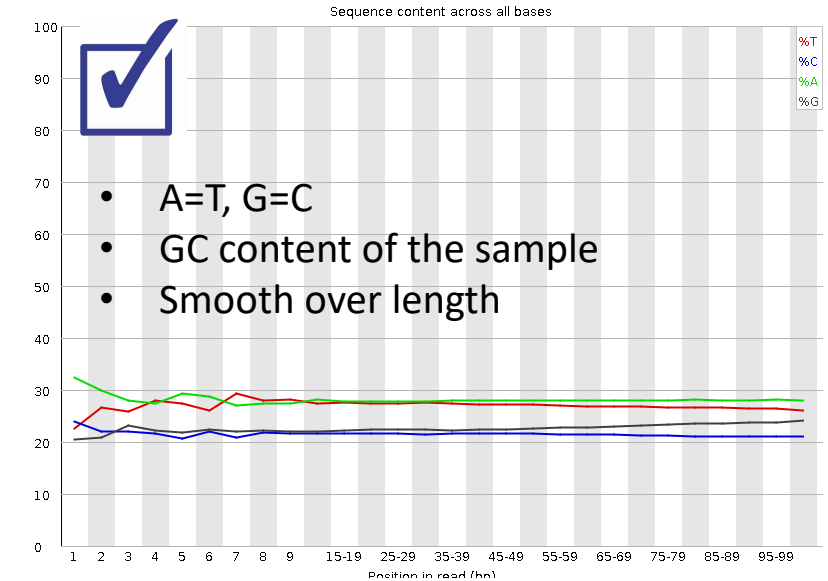
Hotter color: worse quality

Good: universal blue

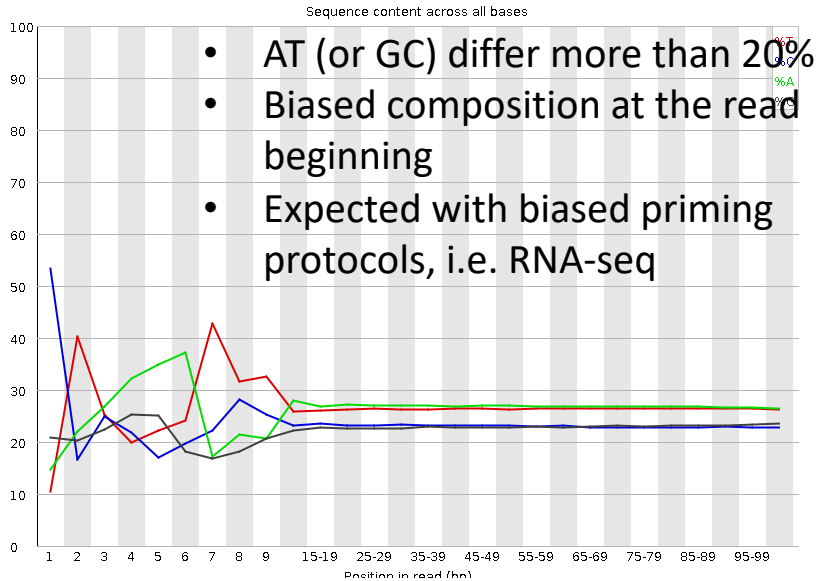
Failure: < average - 5

Per base sequence content - FastQC

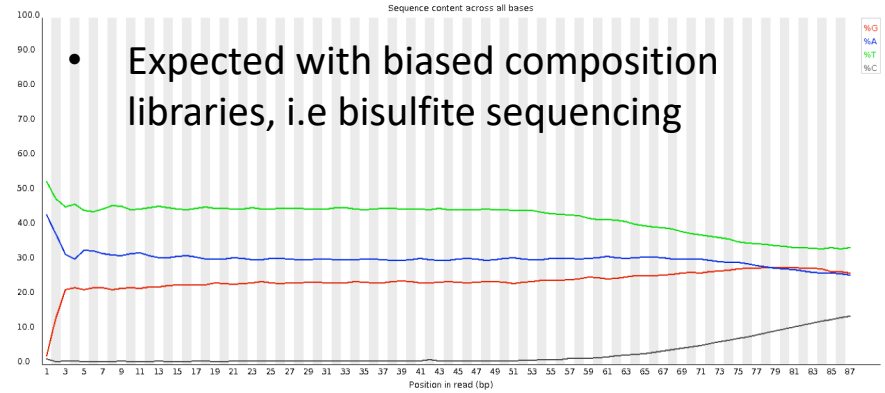
- The portion of A, T, G, and C at each position



- A=T, G=C
- GC content of the sample
- Smooth over length



- AT (or GC) differ more than 20%
- Biased composition at the read beginning
- Expected with biased priming protocols, i.e. RNA-seq



- Expected with biased composition libraries, i.e bisulfite sequencing

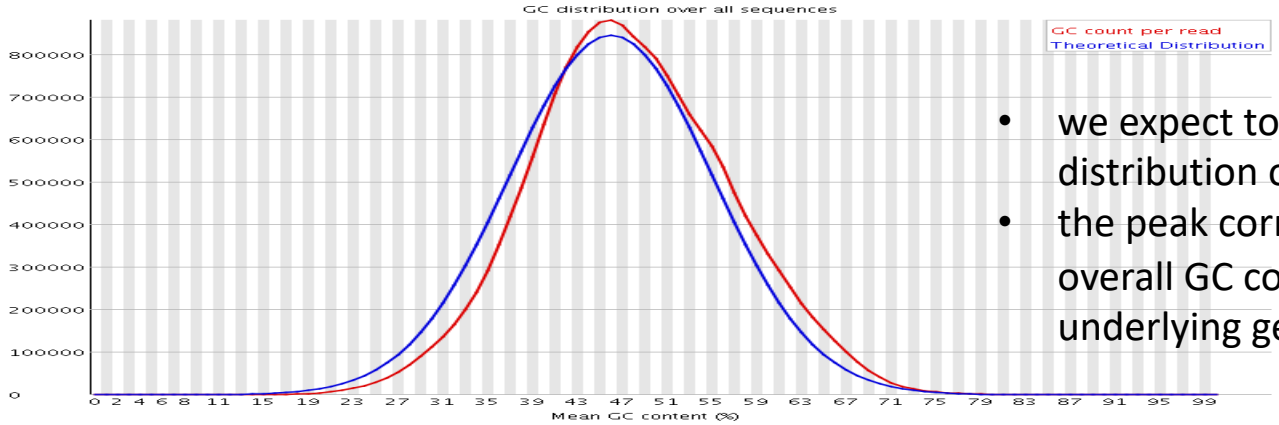
Biases in Illumina transcriptome sequencing caused by random hexamer priming

Kasper D. Hansen[1,*], Steven E. Brenner[2] and Sandrine Dudoit[1,3]

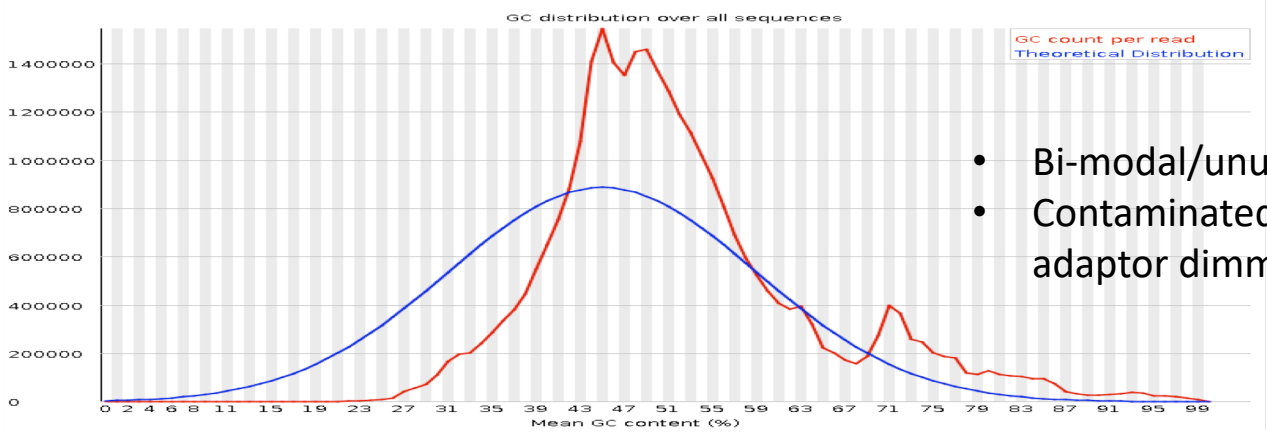
Treatment of DNA with bisulfite converts cytosine to uracil, but leaves methylated cytosine unaffected. Therefore, DNA that has been treated with bisulfite retains only methylated cytosines.

Per sequence GC content - FastQC

- Distribution of average GC in all reads



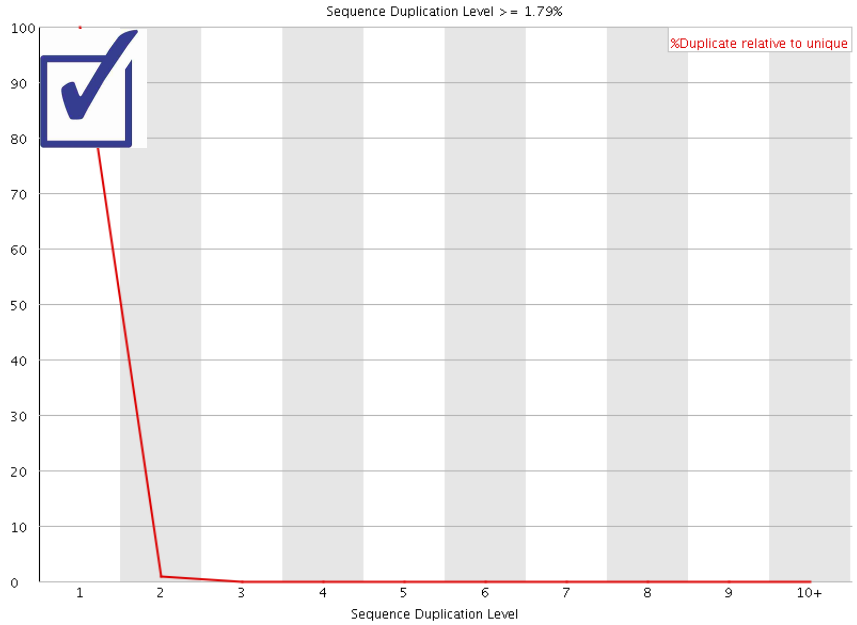
- we expect to see a roughly normal distribution of GC content
- the peak corresponds to the overall GC content of the underlying genome

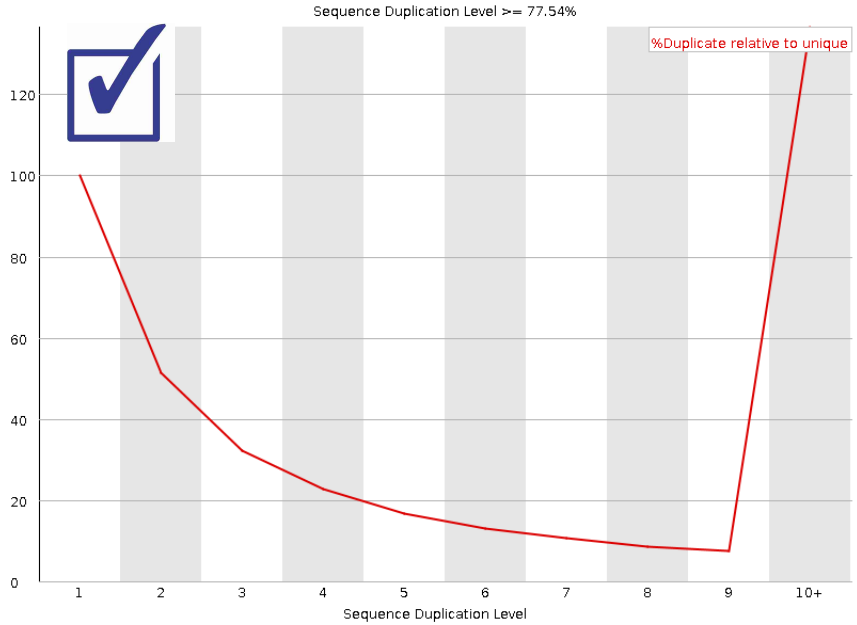


- Bi-modal/unusual distribution
- Contaminated/biased subset, i.e. adaptor dimmers, rRNA etc

Sequence duplication - FastQC

- Relative number of sequences with different degrees of duplication





- Essentially no duplication

High duplication levels:

- DNA-seq: PCR over amplification, too little input material
- Normal in RNA-seq: high expression

Overrepresented sequences - FastQC

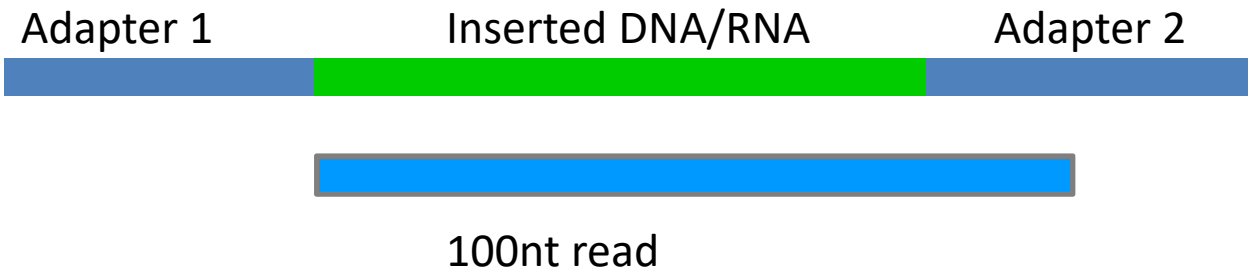
- Sequences make up >0.1 % of the total
- Compare those with a contamination database for finding contamination (i.e. adaptor dimmers)

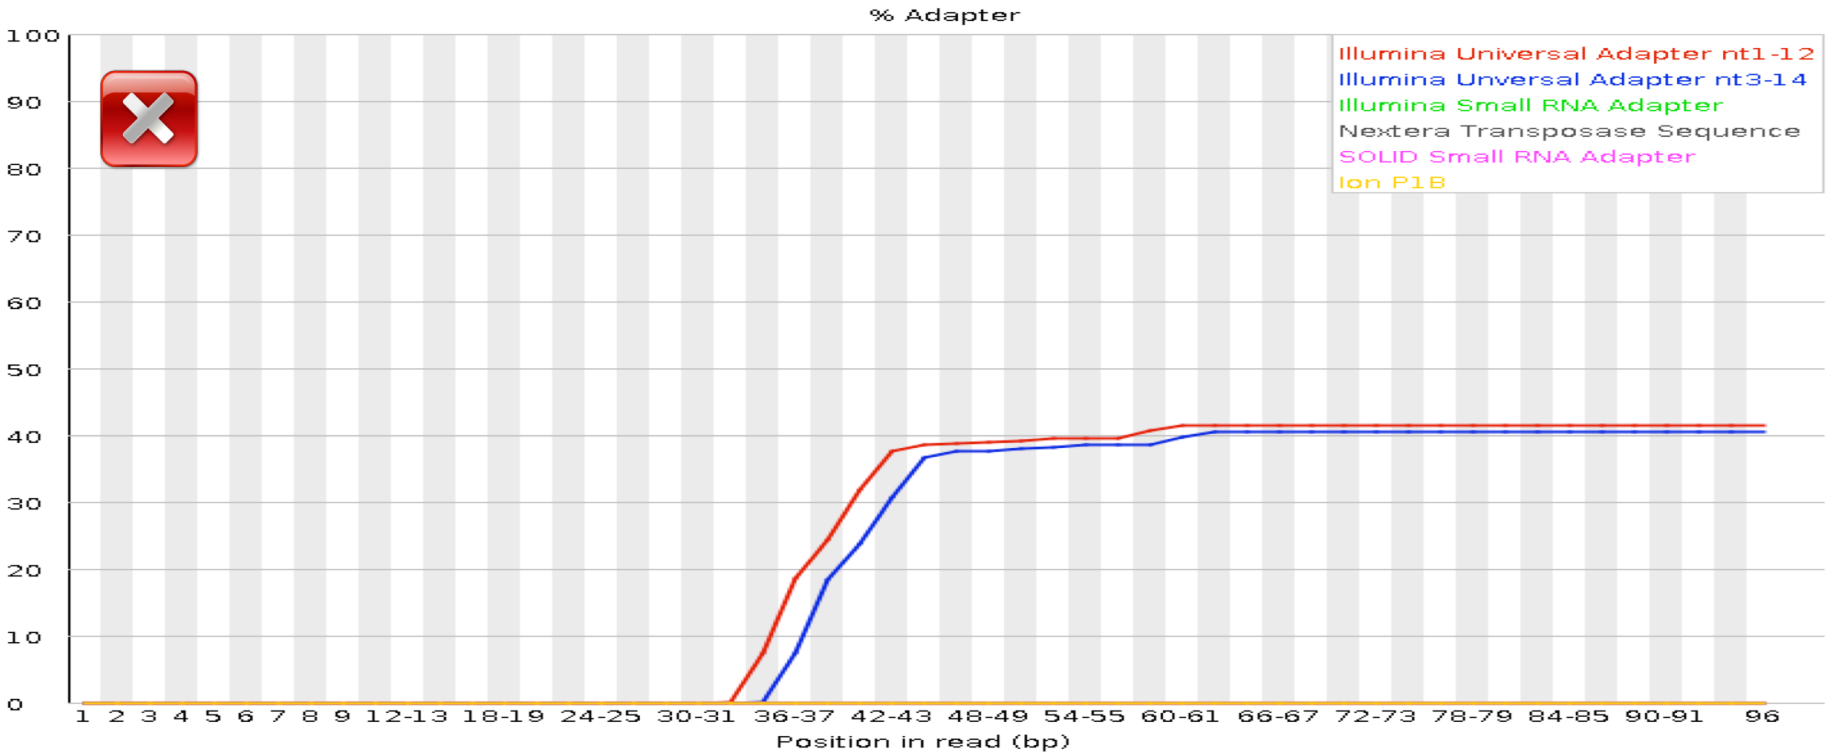
Overrepresented sequences

Sequence	Count	Percentage	Possible Source
GGAAGAGCACACGTCTGAACTCCAGTCACCAGATCATCTCGTATGCCGTC	75874	1.5613887498682963	TruSeq Adapter, Index 7 (100% over 50bp)
GGAAGAGCACACGTCTGAACTCCAGTCACCGATGTATCTCGTATGCCGTC	7636	0.15713900010536297	TruSeq Adapter, Index 2 (100% over 50bp)
GGAAGAGCACACGTCTGAACTCCAGTCACACAGTGATCTCGTATGCCGTC	7539	0.1551428656095248	TruSeq Adapter, Index 5 (100% over 50bp)
GGAAGAGCACACGTCTGAACTCCAGTCACGCCAATATCTCGTATGCCGTC	5117	0.10530123933199874	TruSeq Adapter, Index 6 (100% over 50bp)

- Can be normal and biologically meaningful
  - highly expressed transcripts
  - high copy number repeats
  - Less diverse library (amplicons)

Adapter Content - FastQC





Millions of reads with base resolution

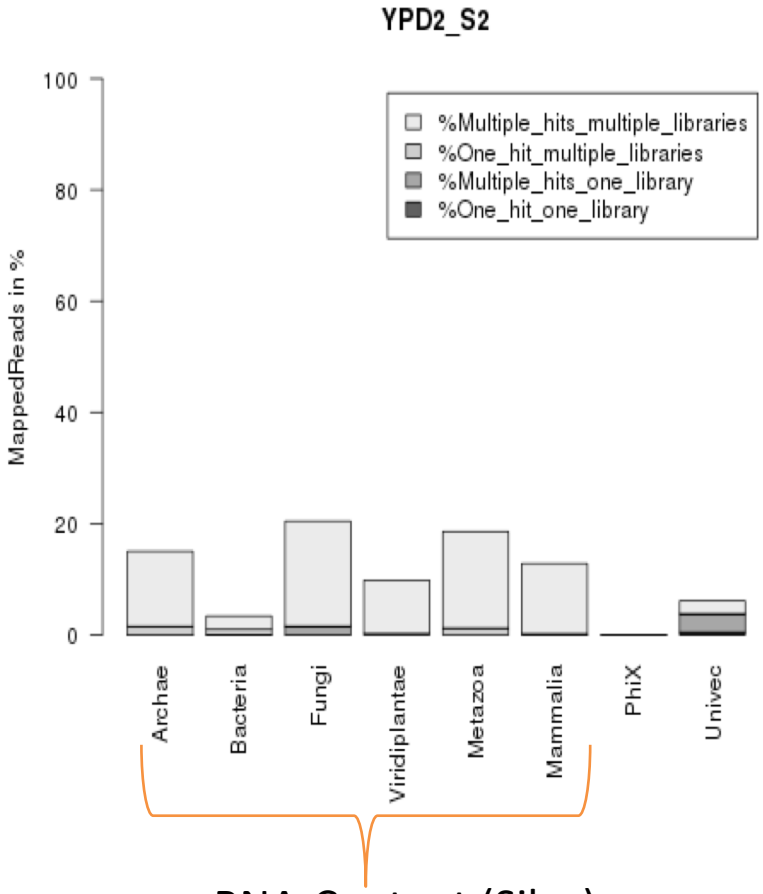
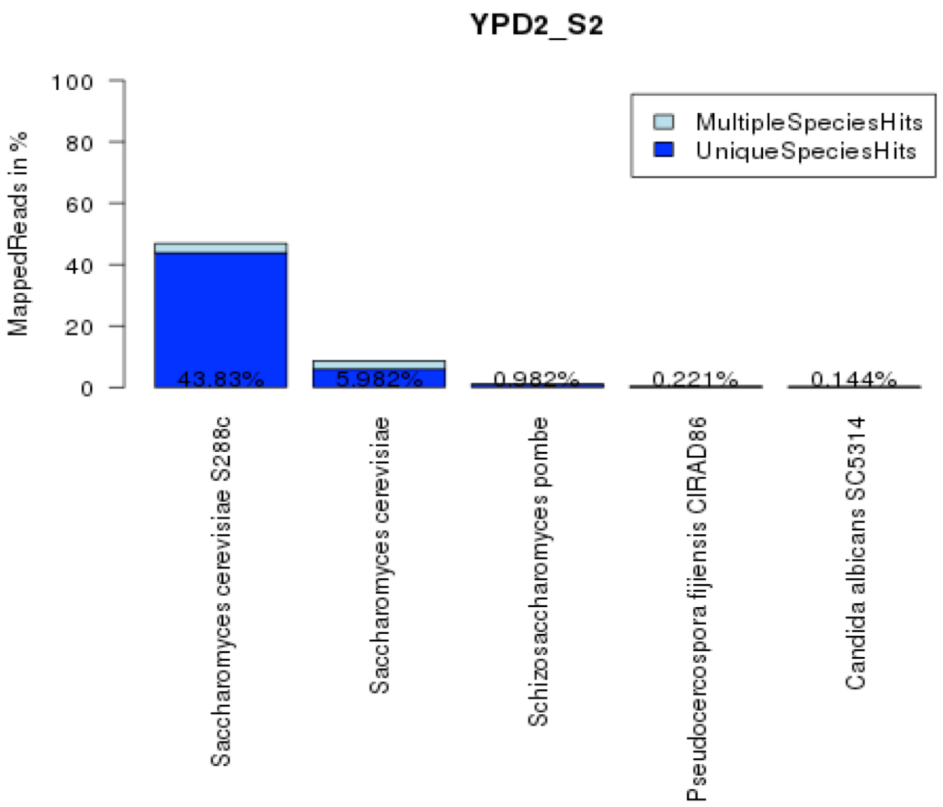
- How accurate was the sequencing → Fastqc
- Are these reads the intented ones → FastqScreen

Contamination Check - FastqScreen



rRNA-Content (Silva)



Mapping to RefSeq mRNAs (all species)

Data preprocessing common tasks

1. Trimming: remove bad bases from (end(s) of) reads
   - Adaptor sequence
   - Low quality bases

2. Filtering: remove bad reads
   - Low quality reads
   - Contaminating sequences
   - Low complexity reads (repeats)
   - Short (<20bp) reads – they slow down mapping software

Data preprocessing software

- PRINSEQ
  - http://prinseq.sourceforge.net/
  - Quality/hard trimming, quality filtering, reformat, ...
- Trimmomatic
  - http://www.usadellab.org/cms/?page=trimmomatic
  - Adaptor trimming, quality trimming &filtering, ...
- FlexBar (FAR)
  - https://github.com/seqan/flexbar
  - Flexible barcode detection and adapter removal
- FASTX
  - http://hannonlab.cshl.edu/fastx_toolkit/
  - Reformat, stats, collapse duplicated reads, trim, filter, reverse compliment
- TagCleaner
  - http://tagcleaner.sourceforge.net
  - Trim MIDs or adaptors, demultiplexing
- DeconSeq
  - http://deconseq.sourceforge.net
  - Remove potential contaminants

Recommendations

- Always generate quality plots for all libraries
- Trim and/or filter data if needed
- Applications where erroneous reads are detrimental
  - de novo assembly
  - low coverage variant calling
